- RESEARCH INTERESTS
- machine learning, anomaly detection, distance metric learning, online semi-supervised learning, structured prediction, bioinformatics, pattern classification, graphical models, spiking neuron networks
- RESEARCH PROJECTS
- ◇ *Online semi-supervised learning* with Branislav Kveton (2009)
I extended graph-based semi-supervised learning to the structured case and demonstrated on handwriting recognition and object detection from video streams. Regularized harmonic function solution: The algorithm outputs a confidence of inference and uses it for learning.
 - ◇ *Anomaly detection* with Milos Hauskrecht (2007 – present)
Statistical anomaly detection methods for identification of unusual outcomes and patient management decisions. I combined max-margin learning with distance learned to create and anomaly detector, which outperforms the hospital rule for Heparin Induced Thrombocytopenia detection.
 - ◇ *Mass Spec Bioinformatics* with Milos Hauskrecht (2005 – 2007)
Tools for analysis of high-throughput proteomic and genomic data sources. I found a way to merge heterogeneous data sources for mass spectrometry (Luminex and SELDI) and build a framework for the cancer prediction.
 - ◇ *Machine Learning* with Nuno Marques (2005)
Evolutionary feature selection algorithms for pattern recognition. I enhanced FeaSANNT selection with spiking neuron model and show that it can handle noised inputs.
 - ◇ *Plastic Synapses* with Juraj Pavlasek (2003 – 2005)
Modelling basic learning function at the level of synapses. Design of a model that is able to adapt to the regular frequencies with different a rate as the time flows. I used genetic programming to find biologically plausible networks that distinguish different gamma distribution and provided explanation of the strategies evolved.
