CS 2750 Machine Learning

Modeling uncertainty with probabilities

- **Full joint distribution:** joint distribution over all random variables defining the domain
 - it is sufficient to represent the complete domain and to do any type of probabilistic inferences

Problems:

- **Space complexity.** To store full joint distribution requires to remember $O(d^n)$ numbers.
 n – number of random variables, d – number of values
- **Inference complexity.** To compute some queries requires $O(d^n)$ steps.
- **Acquisition problem.** Who is going to define all of the probability entries?

CS 2750 Machine Learning

Pneumonia example. Complexities.

- **Space complexity.**

- Pneumonia (2 values: T,F), Fever (2: T,F), Cough (2: T,F), WBCcount (3: high, normal, low), paleness (2: T,F)
- Number of assignments: $2*2*2*3*2=48$
- We need to define at least 47 probabilities.

- **Time complexity.**

- Assume we need to compute the probability of Pneumonia=T from the full joint

$$P(\text{Pneumonia} = T) = \sum_{i \in T, F} \sum_{j \in T, F} \sum_{k=h, n, l} \sum_{u \in T, F} P(\text{Fever} = i, \text{Cough} = j, \text{WBCcount} = k, \text{Pale} = u)$$

- Sum over $2*2*3*2=24$ combinations

CS 2750 Machine Learning

Bayesian belief networks (BBNs)

Bayesian belief networks.

- Represent the full joint distribution over the variables more compactly with a **smaller number of parameters**.
- Take advantage of **conditional and marginal independences** among random variables

- **A and B are independent**

$$P(A, B) = P(A)P(B)$$

- **A and B are conditionally independent given C**

$$P(A, B | C) = P(A | C)P(B | C)$$

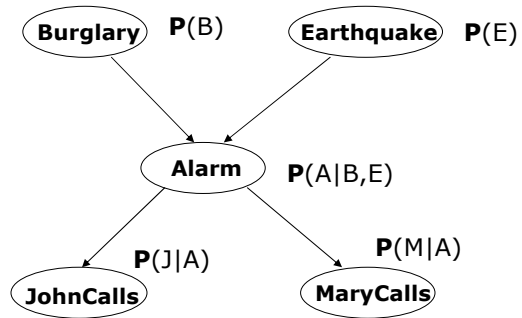

$$P(A | C, B) = P(A | C)$$

CS 2750 Machine Learning

Bayesian belief network.

1. Directed acyclic graph

- **Nodes** = random variables
- **Links** = missing links encode independences.

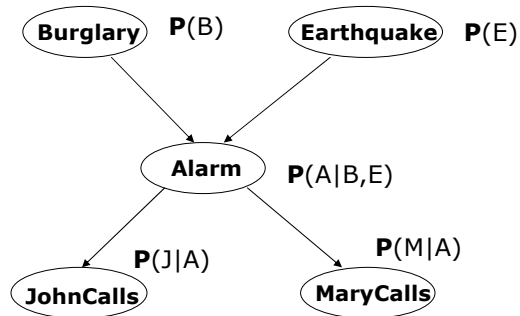

CS 2750 Machine Learning

Bayesian belief network.

2. Local conditional distributions

- relate variables and their parents

CS 2750 Machine Learning

Bayesian belief network

CS 2750 Machine Learning

Full joint distribution in BBNs

Full joint distribution is defined in terms of local conditional distributions (obtained via the chain rule):

$$P(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} P(X_i | pa(X_i))$$

Example:

Assume the following assignment of values to random variables

$$B=T, E=T, A=T, J=T, M=F$$

Then its probability is:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$P(B=T)P(E=T)P(A=T | B=T, E=T)P(J=T | A=T)P(M=F | A=T)$$

CS 2750 Machine Learning

Bayesian belief networks (BBNs)

Bayesian belief networks

- Represent the full joint distribution over the variables more compactly using the product of local conditionals.
- **But how did we get to local parameterizations?**

Answer:

- **Graphical structure** encodes **conditional and marginal independences** among random variables
- **A and B are independent** $P(A, B) = P(A)P(B)$
- **A and B are conditionally independent given C**
$$P(A | C, B) = P(A | C)$$
$$P(A, B | C) = P(A | C)P(B | C)$$
- **The graph structure implies the decomposition !!!**

CS 2750 Machine Learning

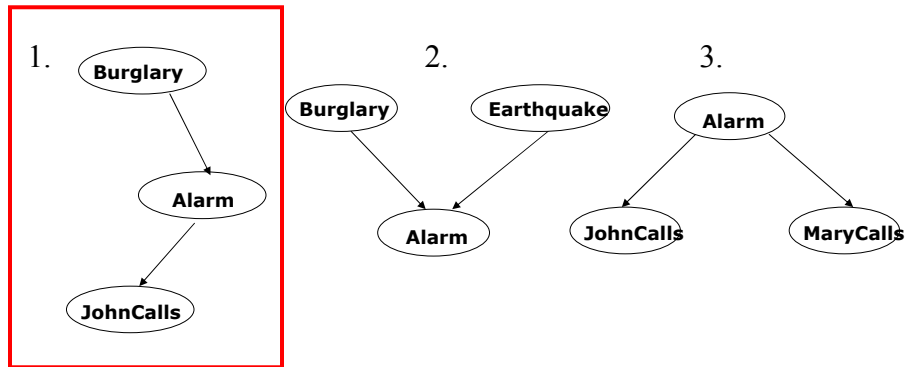

Independences in BBNs

3 basic independence structures:

CS 2750 Machine Learning

Independences in BBNs

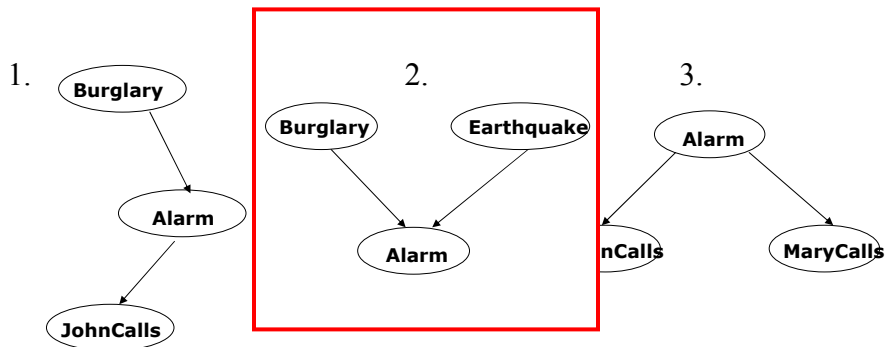

1. JohnCalls **is independent** of Burglary given Alarm

$$P(J | A, B) = P(J | A)$$

$$P(J, B | A) = P(J | A)P(B | A)$$

Independences in BBNs

2. Burglary **is independent** of Earthquake (not knowing Alarm)
 Burglary and Earthquake **become dependent** given Alarm !!

$$P(B, E) = P(B)P(E)$$

Independences in BBNs

3. MaryCalls **is independent** of JohnCalls given Alarm

$$P(J | A, M) = P(J | A)$$

$$P(J, M | A) = P(J | A)P(M | A)$$

CS 2750 Machine Learning

Independences in BBN

- BBN distribution models many conditional independence relations relating distant variables and sets
- These are defined in terms of the graphical criterion called d-separation
- **D-separation in the graph**
 - Let X, Y and Z be three sets of nodes
 - If X and Y are d-separated by Z then X and Y are conditionally independent given Z
- **D-separation :**
 - **A is d-separated from B given C** if every undirected path between them is **blocked**
- **Path blocking**
 - 3 cases that expand on three basic independence structures

CS 2750 Machine Learning

Undirected path blocking

- 1. With linear substructure

- 2. With wedge substructure

- 3. With vee substructure

CS 2750 Machine Learning

Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

CS 2750 Machine Learning

Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} P(B=T, E=T, A=T, M=F)$$

Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} P(B=T, E=T, A=T, M=F)$$

$$P(M=F \mid B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F \mid A=T)} P(B=T, E=T, A=T)$$

Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} P(B=T, E=T, A=T, M=F)$$

$$P(M=F \mid B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F \mid A=T)} P(B=T, E=T, A=T)$$

$$\underline{P(A=T \mid B=T, E=T)} P(B=T, E=T)$$

Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T \mid B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T \mid A=T)} P(B=T, E=T, A=T, M=F)$$

$$P(M=F \mid B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F \mid A=T)} P(B=T, E=T, A=T)$$

$$\underline{P(A=T \mid B=T, E=T)} P(B=T, E=T)$$

$$P(B=T) P(E=T)$$

Full joint distribution in BBNs

Rewrite the full joint probability using the product rule:

$$P(B=T, E=T, A=T, J=T, M=F) =$$

$$= P(J=T | B=T, E=T, A=T, M=F) P(B=T, E=T, A=T, M=F)$$

$$= \underline{P(J=T | A=T)} P(B=T, E=T, A=T, M=F)$$

$$P(M=F | B=T, E=T, A=T) P(B=T, E=T, A=T)$$

$$\underline{P(M=F | A=T)} P(B=T, E=T, A=T)$$

$$\underline{P(A=T | B=T, E=T)} P(B=T, E=T)$$

$$P(B=T) P(E=T)$$

$$= P(J=T | A=T) P(M=F | A=T) P(A=T | B=T, E=T) P(B=T) P(E=T)$$

CS 2750 Machine Learning

Parameter complexity problem

- In the BBN the full joint distribution is expressed as a product of conditionals (of smaller) complexity

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i | pa(X_i))$$

Parameters:
full joint: ?
BBN: ?

CS 2750 Machine Learning

Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid pa(X_i))$$

- What did we save?**

Alarm example: 5 binary (True, False) variables

of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

$$2^5 - 1 = 31$$

Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid pa(X_i))$$

- What did we save?**

Alarm example: 5 binary (True, False) variables

of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

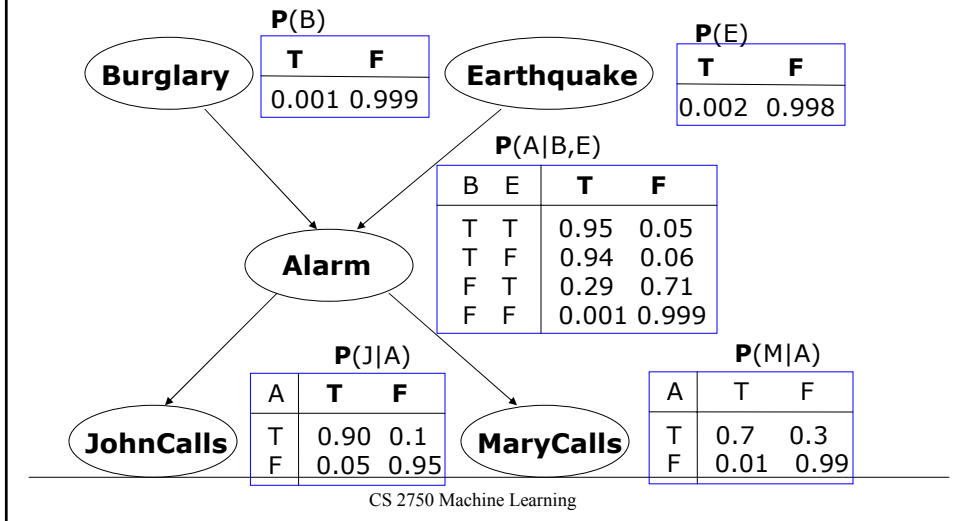

$$2^5 - 1 = 31$$

of parameters of the BBN: ?

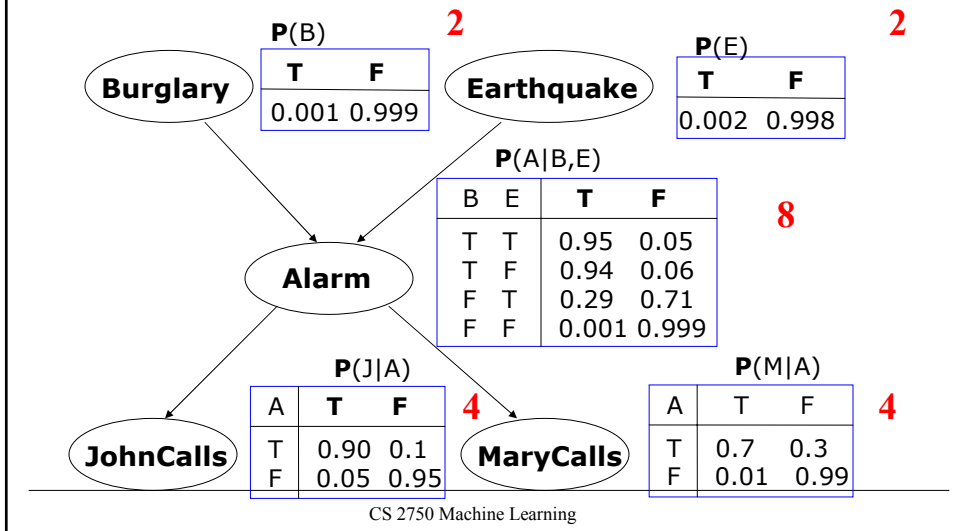

Bayesian belief network.

- In the BBN the **full joint distribution** is expressed using a set of local conditional distributions

Bayesian belief network.

- In the BBN the **full joint distribution** is expressed using a set of local conditional distributions

Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid pa(X_i))$$

- What did we save?**

Alarm example: 5 binary (True, False) variables

of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

$$2^5 - 1 = 31$$

of parameters of the BBN:

$$2^3 + 2(2^2) + 2(2) = 20$$

One parameter in every conditional is for free:

?

CS 2750 Machine Learning

Parameter complexity problem

- In the BBN the **full joint distribution** is defined as:

$$\mathbf{P}(X_1, X_2, \dots, X_n) = \prod_{i=1, \dots, n} \mathbf{P}(X_i \mid pa(X_i))$$

- What did we save?**

Alarm example: 5 binary (True, False) variables

of parameters of the full joint:

$$2^5 = 32$$

One parameter is for free:

$$2^5 - 1 = 31$$

of parameters of the BBN:

$$2^3 + 2(2^2) + 2(2) = 20$$

One parameter in every conditional is for free:

$$2^2 + 2(2) + 2(1) = 10$$

CS 2750 Machine Learning

Model acquisition problem

The structure of the BBN typically reflects causal relations

- BBNs are also sometime referred to as **causal networks**
- Causal structure is very intuitive in many applications domain and it is relatively easy to obtain from the domain expert

Probability parameters of BBN correspond to conditional distributions relating a random variable and its parents only

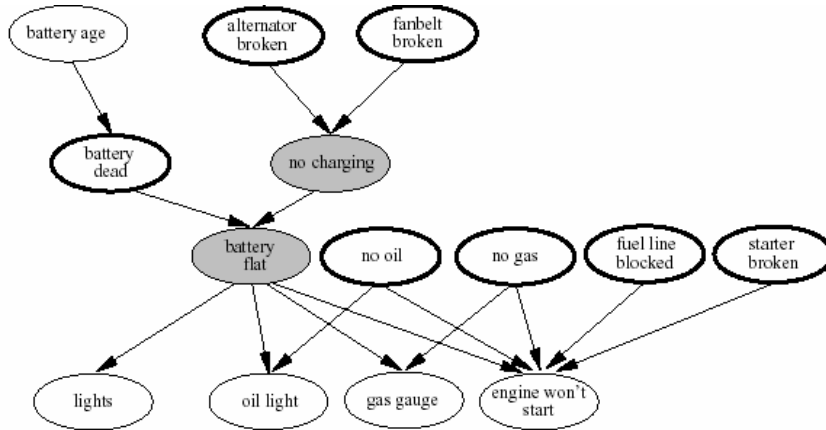

- Their complexity much smaller than the full joint
- Easier to come up (estimate) the probabilities from expert or automatically by learning from data

BBNs built in practice

- **In various areas:**
 - Intelligent user interfaces (Microsoft)
 - Troubleshooting, diagnosis of a technical device
 - Medical diagnosis:
 - Pathfinder (Intellipath)
 - CPSC
 - Munin
 - QMR-DT
 - Collaborative filtering
 - Military applications
 - Insurance, credit applications

Diagnosis of car engine

- Diagnose the engine start problem

CS 2750 Machine Learning

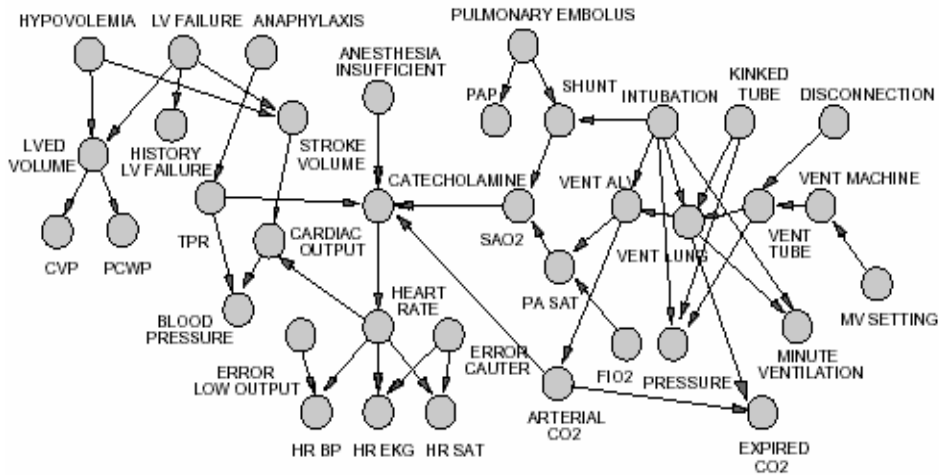

Car insurance example

- Predict claim costs (medical, liability) based on application data

CS 2750 Machine Learning

(ICU) Alarm network

CS 2750 Machine Learning

CPCS

- Computer-based Patient Case Simulation system (CPCS-PM) developed by Parker and Miller (at University of Pittsburgh)
- 422 nodes and 867 arcs

CS 2750 Machine Learning

QMR-DT

- **Medical diagnosis in internal medicine**
 - Bipartite network of disease/findings relations
 - Derived from the Internist-1/QMR knowledge base
