CS 0008 Fall 2013 - Information about the Final Exam

- The final is Tuesday, Dec 10, 4pm - 5:50pm in our usual classroom.
- The final is cumulative, and covers the lectures, reading assignments, assignments, and labs
- Hint: There will be a question about wannabe.py, and a question about the madlib programs, so be sure you understand that code.
- A separate handout will contain “help” information on string, list, and dictionary methods, specifically, what is printed in the shell when you enter, e.g., help(append). You will not need to use all of them!
- The following comment will appear on the front of the exam:

Unless you think there is an error, I can't answer any questions. Otherwise, it gets too noisy, and some people would get more information than others.

Please just follow the instructions, and use your best judgment.

- The exam is closed everything except you and your pencil (and eraser/sharpener).
- Study actively. Don't just pass your eyes over the text and materials from lecture. Make sure you understand all the pieces of it. Run the code given to you. Try your own commands in the Python shell. If you are confused, trace code on paper then run the code to check yourself. You can use the debugger to see the values that variables are assigned as the program executes.
- Below are the types of questions that will be on the exam. These are the same as for Exams 1 and 2.
 - **Short answer question.**
 - **Fixing an error.**
 - **Tracing code.**
 - **Giving the output of some code.**

- **Writing a function.**
- **Calling functions to do something.**
